

# **Developing and Using Social Embeddedness As an Explanatory Variable**

by  
**Paul B. Reed**  
and  
**L. Kevin Selbee**

**Statistics Canada and Carleton University  
Ottawa**

**Presented at the Annual Conference of the Society for the Advancement  
of Socio-Economics, Aix-en-Provence, France.  
June 26 – 28, 2003**

- **What social embeddedness is**
- **Social embeddedness in social science**
- **Dimensions and components of social embeddedness**
- **Some probable effects of social embeddedness**
- **Social embeddedness as an explanatory factor:  
measuring its impact on health**
- **In progress:**
  - **Social Embeddedness, Civic Engagement,  
and the Public Good**
  - **Serious Youth Violence and  
Social Embeddedness**

## **Dimensions and Measures of Social Embeddedness**

### **A. Social Connectivity (= links to one's social context)**

- relationships and interactions with non-household family members
- knowledge of and relationships and interactions with close, and general, friends
- knowledge and relationships and interactions with neighbours, coworkers
- links and contacts with, and participation in, organizations and institutions
- feelings of attachment and identity towards the social and cultural context
- being married
- having young children
- being employed
  - [not only magnitude and frequency, but also whether within a network]
- following news and public affairs through the media

### **B. Social Anchoring (= values, beliefs, and life-ordering principles, especially when periodically affirmed with like-minded people)**

- strength and importance of values and beliefs
- religious observation and participating in a religious or secular community of faith
- engaging in giving and volunteering

### **C. Social Continuity**

- duration of marriage
- duration of employment
- duration of residence in current community
- duration of selected relationships and memberships
- mean duration of friendships, age-standardized

# **Some Probable Effects of Social Embeddedness**

## **1. On Individuals:**

Expressive and Sentient Aspects

- affirmation of individual's worth
- attachment

Instrumental Aspects

- reduces uncertainty and risk
- increases social and physical security
- enables coping by providing social, emotional, physical support
- lowers costs of interactions and transactions by increasing trust
- provides basis for norms and practice of reciprocity, mutual aid
- heightened sense of personal responsibility

## **2. On Groups, Communities and Collectivities**

- provides basis for shared meanings and understandings
- fosters awareness of and support for the collective good
- increases likelihood of concerted action
- provides basis for concern about fairness and justness
- increases effectiveness of social reproduction
- greater adaptability to social change and societal heterogeneity
- more robust economic domain

# **Study on Social Embeddedness and Positive Health**

## **Data Sources**

National Population Health Survey 1996-97	62,887 respondents*
General Social Survey Cycle 12 Time Use Survey 1998	9,847 respondents*
Individuals, Institutions and the Social Contract 1997	1,929 respondents*
National Survey of Giving, Volunteering and Participating 1997	16,771 respondents*

\* All analyses are based on respondents age 20 and over.

## **Dependent Variables for Embeddedness and Health**

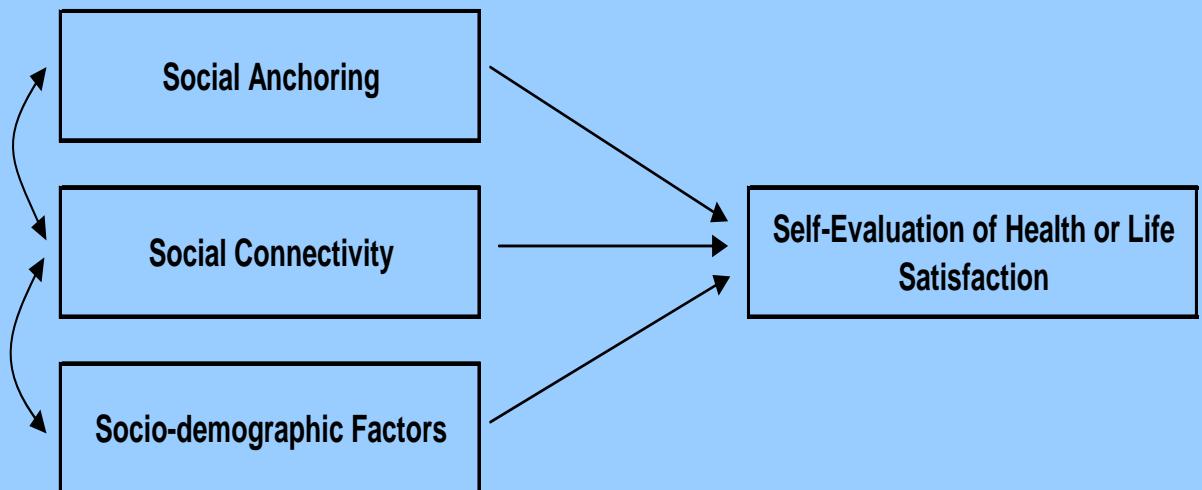

---

National Population Health Survey 1996-97	Objective Health rating Subjective Health rating
General Social Survey Cycle 12 Time Use Survey 1998	Subjective Health rating Overall Satisfaction
National Survey of Giving, Volunteering and Participating 1997	Subjective Health rating Overall Satisfaction
Individuals, Institutions and the Social Contract 1997	Overall Satisfaction Trust in Others

---

## A Structural Model of the Impact of Embeddedness on Self-Evaluations of Health or Life Satisfaction

---

---

## **Social Embeddedness and Positive Health — Initial Findings**

1. Logistic regression modelling of the impact of a large array of social, economic and demographic variables, from four national surveys showed social connectivity and social anchoring to be consequential — i.e., to produce a significant increase in  $R^2$  — of up to 36%.
2. The impact of the social connectivity and anchoring measures varies considerably across the different surveys.
3. Social connectivity has stronger effects than social anchoring.
4. Social connectivity and social anchoring variables are statistically significant in the models.
5. Social connectivity and social anchoring variables better account for positive life satisfaction than for positive health evaluation(s).
6. In 2 survey datasets (NPHS, NSGVP) religiosity has a negative effect on positive health, and in 2 datasets (NSGVP and IISC) a negative effect on life satisfaction. The implication is that religious individuals are less embedded.
7. Embeddedness variables exert a significant effect on actual (objectively measured) health status as well.

# **Social Embeddedness Study: Selected Findings**

1. Wide variation in results from different data sources, ranging from very strong to weak. Social embeddedness accounted for the following maximum proportions of the explained variation:
  - 20% --- Subjective Health
  - 36% --- Overall satisfaction
  - 14% --- Objective health
2. The relative influence of social embeddedness is:
  - on a par with that of language, gender, urban-rural location, marital status and immigrant status
  - less than that of age and occupation
3. Social connectivity is a slightly more important component than social anchoring, as an influence on actual health.
4. Regarding social capital: Trust is a statistically important influence on overall satisfaction, but (Robert Putnam notwithstanding) social embeddedness does not affect levels of trust.

## Explained Variance in models of health and satisfaction
